Name:

Write down answers in-between questions. Please answer using short sentences. The given spaces should be more than enough.

- 1. How many bytes are necessary to store a 1024×1024 color image with an alpha channel using 8 bits per channel ?
- 2. What is a parametric form (or explicit equation) for the axis-aligned 2D ellipse of which center is at p, width and height are a, b? (hint: use parameter $t \in [0,2\pi)$. e.g., { $f(t) \mid t \in [0,2\pi)$ })
- 3. Write down the 4×4 rotation matrix M that maps the orthonormal 3D vectors $\mathbf{u}=(x_u,y_u,z_u),\mathbf{v}=(x_v,y_v,z_v),$ and $\mathbf{w}=(x_w,y_w,z_w),$ to orthonormal 3D vectors $\mathbf{a}=(x_a,y_a,z_a),\mathbf{b}=(x_b,y_b,z_b),$ and $\mathbf{c}=(x_c,y_c,z_c),$ so $M\mathbf{u}=\mathbf{a},M\mathbf{v}=\mathbf{b},$ and $M\mathbf{w}=\mathbf{c}.$

4. Represent vector c and d in terms of vector a and b using the cross product operator (×) and the length operator (| |). Vector a, b, c are in the same plane, d is orthogonal to the other vectors, a is orthogonal to c and d, and all vectors are unit vectors.

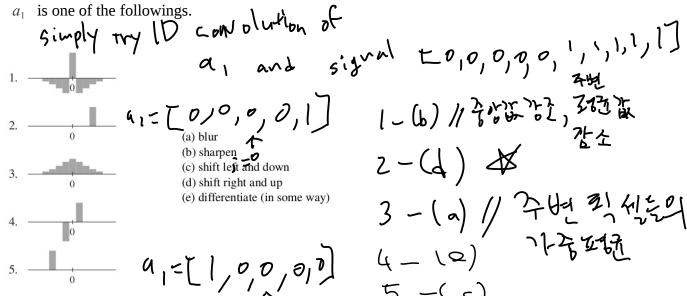

5. If the following 1D discrete filters are used to define 2D filters and applied to images, which filter goes with which operation? hints: assuming $a[i, j] = a_1[i]a_1[j]$, a filtering operation can be defined using the convolution operator * as follows:

 $(a*b)[i,j] = \sum_{i',j'} a[i',j']b[i-i',j-j'] = \sum_{i'} a_1[i'] \left(\sum_{j'} a_1[i'] b[i-i',j-j']\right) \text{ , where 1D}$

filter a_1 is one of the followings.

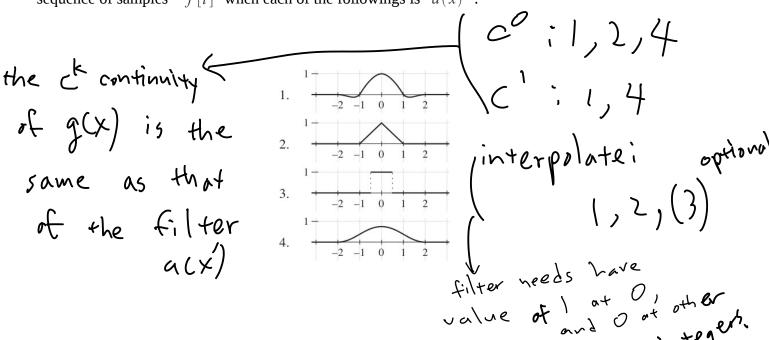

5 -(0)

6. If we use each of the following 1D reconstruction filters to reconstruct a continuous function g(x) from a sequence of samples f[i] using continuous-discontinuous convolution, for which filters will g(x) be C^0 ?

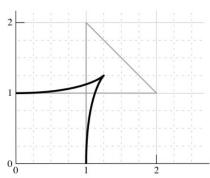

For which filters will g(x) be C^1 ?

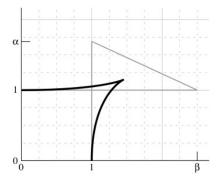

For which filters will g(x) interpolate f[i] ?

hints: the reconstructed function g(x) is defined as $g(x) = \sum_{i} f[i] a(x-i)$ for a arbitrary sequence of samples f[i] when each of the followings is a(x).

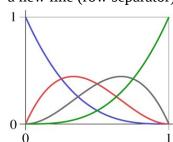

7. Bezier spline with the control points (1, 0), (1, 2), (2, 1), (0, 1) will form a cusp, as shown here on the left:

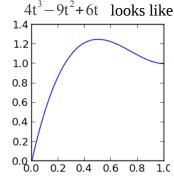

- a. Sketch plots of the coordinate functions x(t) and y(t) and their derivatives. Explain how you can tell that the cusp happens by looking at these plots.
- b. What are the parametric (C^k) continuity and geometric (G^k) continuity at the cusp?

hints: a Bezier spline is defined using matrix [-1 3 -3 1; 3 -6 3 0; -3 3 0 0; 1 0 0 0]. Here ";" represents a new line (row separator). The bezier basis functions look like

(4) 4^{2} 4 (1) $\begin{pmatrix} -1 & 3 & -3 & 1 \\ 3 & -6 & 3 & 0 \\ -3 & 3 & 0 & 0 \end{pmatrix}$ $\begin{pmatrix} 1 & 0 \\ 1 & 2 \\ 2 & 1 \end{pmatrix}$

 $= \left(\begin{array}{ccc} +3 & +2 & + \\ & & \end{array} \right) \left(\begin{array}{ccc} -4 & + \\ 3 & -9 \\ & & \end{array} \right) = \left(\begin{array}{ccc} x & +4 \\ & & \end{array} \right)$ $= \left(\begin{array}{ccc} +3 & +2 & + \\ & & \end{array} \right) \left(\begin{array}{ccc} -4 & + \\ & & \end{array} \right) = \left(\begin{array}{ccc} x & +4 \\ & & \end{array} \right) = \left(\begin{array}{ccc} x & +4 \\ & & \end{array} \right)$

is the above plot is y(t),

and x(t) is a vertically mirrored when t= 0.5

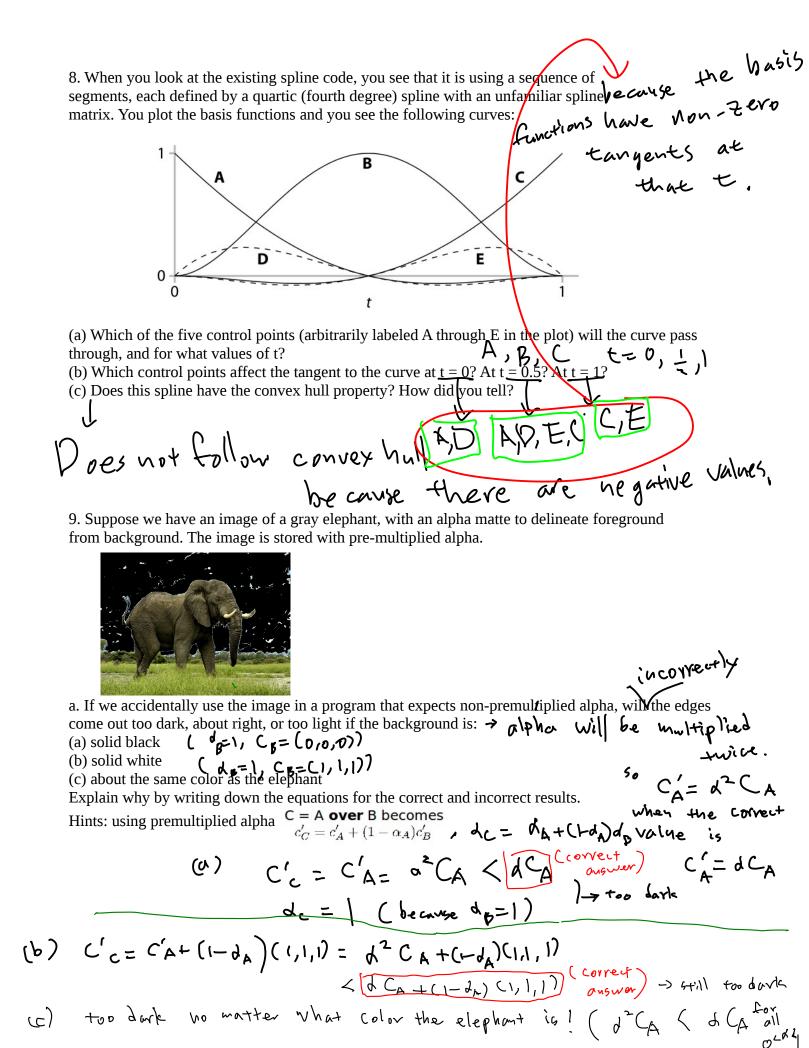

version of y(t).

At the peak of x(t), y(t),

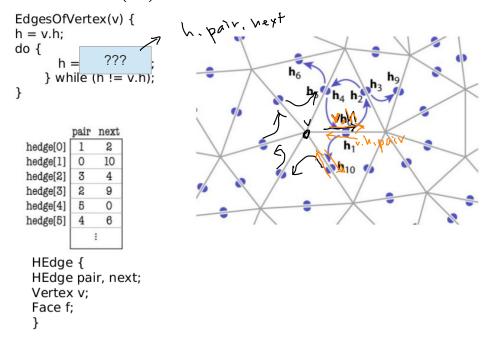

I't the slope x'(4), y'(t) =0,

(y'L+)=12+2-(8+46=6(2+-1)(+-1))

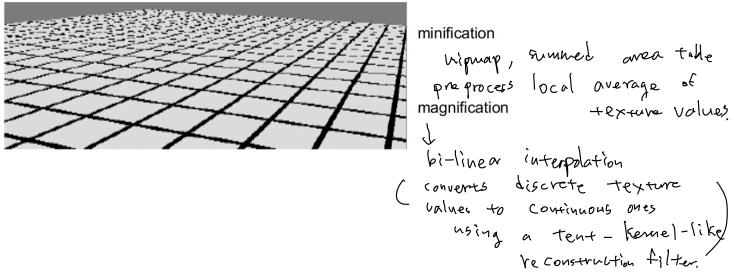

and the sign of both x'(t), y'(t) changes when t=0.5 Thus, the cusp

10. EdgesOfVertex is a function that iterates through the list of half edges adjacent to vertex v. Fill in the blanks (???).

11. Briefly describe algorithms to reduce the artifacts caused by the minification (two algorithms) and magnification (one algorithm) of textures.

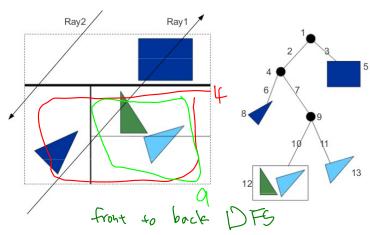

12. Construct a summed area table from the texture below, and explain how you can calculate the average value of the right half of the texture using the summed area table.

1	6	8	3
0	0	3	7
4	7	8	8
5	0	9	9

Sum:
$$T(4,4) - T(4,0)$$

 $-T(2,4)$
 $+T(2,0)$
 $= 18 - 23 = 55$
 $= 55$
 $= 55$
 $= 55$
 $= 55$
 $= 55$
 $= 55$

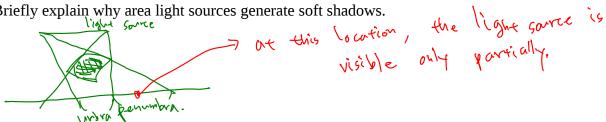

13. Write down a sequence of numbers in the order that the k-d tree is traversed when checking intersections between a ray and the scene. Each number at an internal node represents the intersection test between the ray and the axis-aligned bounding box corresponding to the node. The numbers at the leaf nodes represents the intersection test between the ray and the primitives. The number at the arrow represents the tree traversal. Omit numbers that correspond to pruned operations (that is not executed). Do not exclude intersection tests that fails; for example, the correct answer is "1" for a ray that doesn't collide with the outer-most bounding box.

1-2-4-16-18-10-11-13-10-12 Ray 1:

1-34-5-72-4-77-9-6-8 Ray 2:

14. Briefly explain why area light sources generate soft shadows.

15. Briefly explain how a spline curve can be drawn to the screen using OpenGL.

First Convert a curve to line sequents by uniformly sampling or recursively subdividing the spline curve.

The resulting line segments can be aptionally converted to a triangle strip before senting to the graphics pipeline.
